TEACHING ACTIVITIES (PRIMARY COURSES)

Since 1988 I have taught undergraduate and graduate courses at the University of Pennsylvania. This teaching activity includes the following.

1. **Physics 101** and **Physics 102** (in current numbering system, **Physics 0101 / Physics 0102**). This *Introductory Physics* series is taken primarily by undergraduates who are interested in a career in medicine. **Physics 101** is largely *Mechanics*, and **Physics 102** is largely *Electricity and Magnetism*, with additional materials in *optics, thermodynamics, etc.*
2. **Physics 008** (in current numbering system, **Physics 0008**). This is an *Introductory Physics* course for *Architects*. **Physics 008** covered *Mechanics* (including statics), and other topics such as *heat transfer, materials, and optics*, which were advised by Architecture faculty.
3. **Physics 230** (in the current numbering system, **Physics 1230**). This Sophomore Level physics course is for aspiring majors. A major and central topic in the course is *Vibrations and Waves*. More recently, our faculty voted to include other topics including *Special Relativity* and *Classical Thermodynamics* which I have also taught in the course.
4. **Physics Lab Lecture** (no longer offered). When I arrived at Penn, a lecture was dedicated to the labs for the Introductory Physics courses such as **Physics 101/102, 150/151**. The course involved a weekly lab lecture about basic lab-related problems in *mechanics, electricity and magnetism, optics, and statistical analysis*; it also involved managing the labs and coordinating activity with the primary lecture course.
5. **Physics 421/529** (in current numbering system, **Physics 4421/5529**). I developed this course from scratch at Penn. It is a *Modern Optics* course intended for Senior Physics Majors, but it became apparent early-on that the course was very valuable for graduate (PhD and MD) students working in optics (*e.g.*, in the Physics and Astronomy department, and also in other departments such as Chemistry, Materials Science and Engineering, Chemical Engineering, Electrical Engineering, and Medical Physics). Since so many graduate students (PhD, MD) took the course, we augmented the course number to be **Physics 529**. Topics covered include: *introduction to wave phenomena (mainly math), wave propagation, light interactions with linear media, geometric optics-based and spectroscopic devices, Gaussian beams, diffraction/interference, holography, Fourier optics, coherence, polarization, quantum mechanical light-matter interactions, linear spectroscopy, lasers (introductory), nonlinear spectroscopy (introductory), scattering from fluctuating media*. The course sometimes includes informal labs, time-permitting.

6. **Physics 530** (in current numbering system, **Physics 5530**). In essence, this course is **Modern Optics II**; it is an advanced version of **Physics 421/529**. Topics covered include: *formal solutions of wave equation, Gaussian beams, resonators, guided waves (including coupled guided waves), photonic crystals and metamaterials, quantum mechanical linear and nonlinear spectroscopy, photon echoes, nonlinear optics, nonlinear microscopies, comprehensive theories of the laser, light forces (optical tweezers), light scattering, photon correlation spectroscopies, photon statistics, light diffusion, and more/different depending on time and progress in field.* **Physics 530** connects optics fundamentals to current research in optics, or in applications of optics to other fields.
